

In-class Exercise 1

● Graded

Student

Jinku Jung

Total Points

4 / 4 pts

Autograder Score

0.0 / 0.0

Question 2

Submission

4 / 4 pts

2.1 Submission

■ 4 / 4 pts

✓ + 1 pt Compressed submission as zip

✓ + 1 pt Both files submitted, one .java and one .txt file

✓ + 1 pt Java files runs and prints

✓ + 1 pt readMe.txt is not empty

💬 Wow I actually learned from your readMe! That's really cool! Welcome to Columbia and I hope you enjoy this class, let us know if there's anything we (the TAs) can do to make the class better for you! You can certainly succeed here and this class will serve as an excellent foundation for the courses to come if you take it seriously! I came with no prior experience and ended up well prepared for Data Structures! Once you get through AP you'll feel like a wizard programmer.

```
1 // *****
2 // Exercise1
3 //
4 // In this exercise you will simply print your favorite greeting to the
5 // monitor (No obscenities please!). What you are really doing is just
6 // getting comfortable with the tools we'll be using this semester.
7 //
8 // In addition to this program, create a plain text file. In it,
9 // spend a paragraph telling me and the rest of teaching staff
10 // a little about yourself. Name your text file readMe.txt
11 //
12 // When you have finished, export your project from Codio. Then
13 // put this file, Excercise1.java, and your readMe.txt file
14 // into a single folder called [your_UNI]_ex1 and compress that
15 // folder into a zip file. Finally, submit that zip file on Gradescope.

1 About Me

2

3 Hi my name is Jinku Jung and I'm a nontraditional GS student. I originally had a class like this at Stanford called "CS106A" a very long time ago. Back then, we learned it in Objective-C and had the world's worst interpreter, Thetis. The thing would only compile code reliably in System 9 on the Macintosh--many times, I finished my assignment on the Windows version only to have it randomly crash and lose all my work! But, by being forced to code everything again from scratch, I guess I learned by reinforcement? Anyways, I learned CS purely out of interest for the programming projects: Karel, MiniSim, Yahtzee, StanfordScape, and the text-based MUD game Adventure. Yet I always struggled to get above a B on the assignments, due to the fact that I was prone to hard-coding and rarely did edge-case scenario testing to make my code more extensible and efficient.

4

5 I learned how to code just based on rudimentary trial-and-error, process of elimination (thank God for debugger breakpoints!!!), and idomatic knowledge of algorithms. Yet on exams, I always got reamed due to the fact I did not learn the t h e o r y behind the algorithms. Why did they work? It was only when I learned Discrete Math that mistakes like fencepost errors in "for" loops started to make sense. CS is really based off of concrete ideas such as Set Theory, Symbolic Logic, Sigma Notation, Mathematical Induction, and Graph Theory. *Math* is the real magic behind the code :-) Even complicated pointer arithmetic mixing pass by reference with pass by address just meant I had to break things down line-by-line and writing out variables & values on notecards as I progressed through the particular function.

6

7 This shaky foundation did not bode well in Data Structures. I had no clue what I was doing or how recursive algorithms worked. I swore to myself I would never approach CS again unless I had the foundational knowledge to actually know what I am doing. Now, many years later, I sincerely hope my preparation will pay off this time around. I only hope to make it to Data Structures this Summer. I refuse to offically call myself a real CS major until I pass Advanced Programming with flying colors. Let's just hope I make it that far...
